UVA CS 4774: Machine Learning

S3: Lecture 16: Generative Bayes Classifiers

Dr. Yanjun Qi

University of Virginia

Department of Computer Science

Three major sections for classification

- We can divide the large variety of classification approaches into roughly three major types

1. Discriminative

   directly estimate a decision rule/boundary

   e.g., support vector machine, decision tree, ~~logistic regression,~~

   e.g~~. neural networks (NN), deep NN~~

2. Generative:

   build a generative statistical model

   e.g., Bayesian networks, Naïve Bayes classifier

3~~. Instance based classifiers~~

   - Use observation directly (no models)

   ~~- e.g. K nearest neighbors~~

Roadmap : Generative Bayes Classifiers

- ✓ Bayes Classifier (BC)
  - Generative Bayes Classifier
- ✓ Naïve Bayes Classifier
- ✓ Gaussian Bayes Classifiers (Extra)
  - Gaussian distribution
  - Naïve Gaussian BC
  - Not-naïve Gaussian BC ➔ LDA, QDA

Review: Bayes classifiers (BC)

- Treat each feature attribute and the class label as random variables.

- Testing: Given a sample **x** with attributes ($x_1, x_2, \ldots, x_p$):
  - Goal is to predict its class *c.*
  - Specifically, we want to find the class that maximizes $p(c \mid x_1, x_2, \ldots, x_p)$.

- Training: can we estimate $p(C_i \mid \mathbf{x}) = p(C_i \mid x_1, x_2, \ldots, x_p)$ directly from data?

$$c_{MAP} = \underset{c_j \in C}{\operatorname{argmax}} P(c_j \mid x_1, x_2, \ldots, x_p)$$

MAP Rule

Two kinds of Bayes classifiers via MAP classification rule

- Establishing a probabilistic model for classification
  - (1) Discriminative
  - (2) Generative

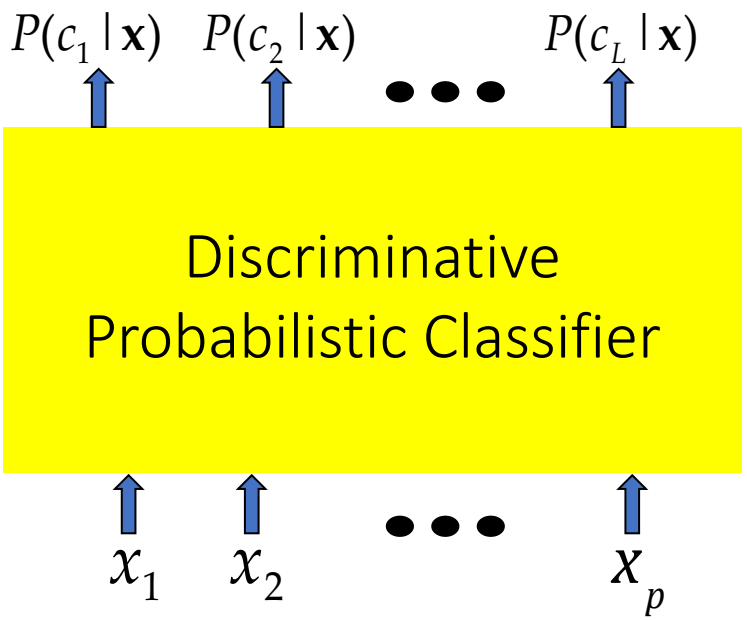
Review: Discriminative BC

Softmax

$$p(\hat{y}_i|\vec{x}) = \frac{e^{z_i}}{\sum_{j=1}^{I} e^{z_j}}$$

- (1) Discriminative model

$$\arg\max_{c \in C} P(c \mid \mathbf{X}), \quad C = \{c_1, \cdots, c_L\}$$



$$\mathbf{x} = (x_1, x_2, \cdots, x_p)$$

multi-class

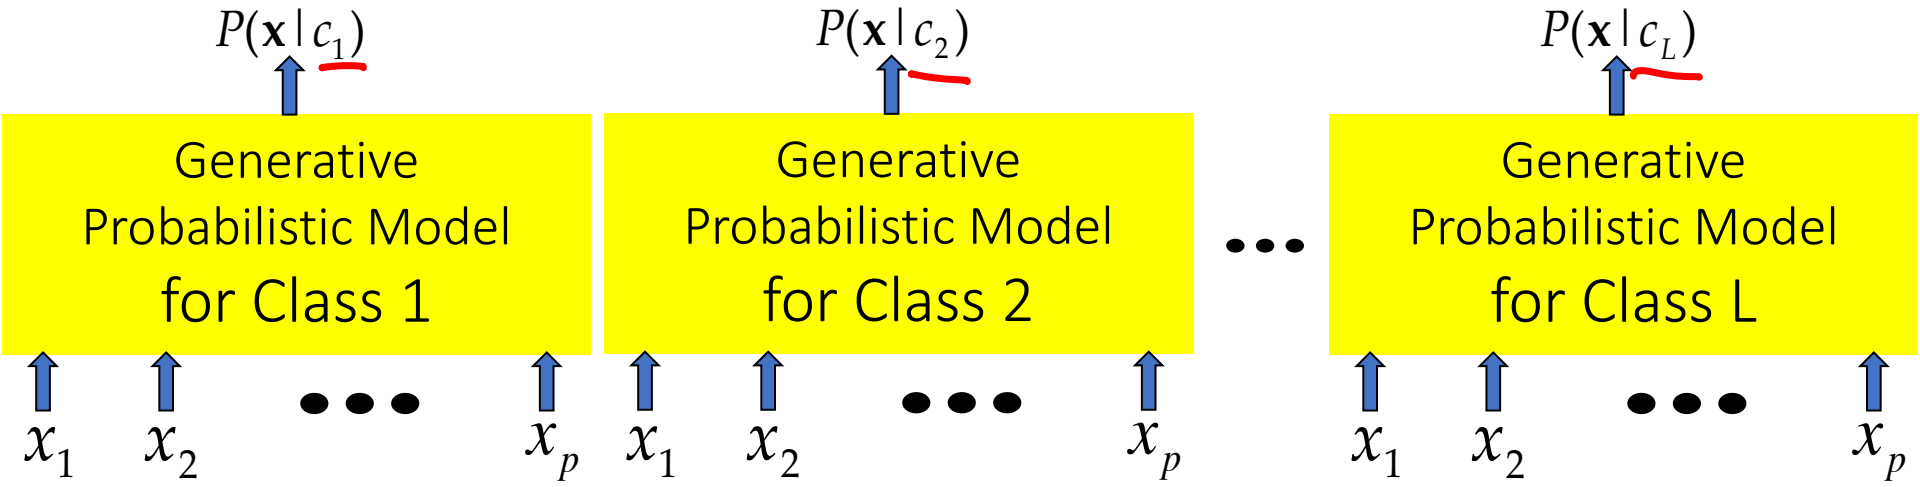
logistic regression

Adapt from Prof. Ke Chen NB slides

(2) Generative BC

$P(\mathbf{X}|C)$,

$C = c_1, \cdots, c_L, \mathbf{X} = (X_1, \cdots, X_p)$



$\mathbf{x} = (x_1, x_2, \cdots, x_p)$

Adapt from Prof. Ke Chen NB slides

Review Probability: If hard to directly estimate from data, most likely we can estimate

- 1. Joint probability
  - Use Chain Rule
- 2. Marginal probability
  - Use the total law of probability
- 3. Conditional probability
  - Use the Bayes Rule

$$p(c_i|\vec{x}) = \frac{p(\vec{x}|c_i)\,p(c_i)}{p(\vec{x})}$$

$$\Downarrow$$

$$c^* = \underset{c_i \sim \{c_1, c_2, \cdots, c_L\}}{\operatorname{argmax}}\ p(c_i|\vec{x})$$

Review : Bayes' Rule – for Generative Bayes Classifiers

$$P(C \mid X) = \frac{P(X \mid C)P(C)}{P(X)}$$

$P(C_1|x), P(C_2|x), \ldots, P(C_L|x)$

$P(C_1), P(C_2), \ldots, P(C_L)$

$$P(C_i \mid \mathbf{X}) = \frac{P(\mathbf{X} \mid C_i)P(C_i)}{P(\mathbf{X})}$$

Review : Bayes' Rule – for Generative Bayes Classifiers

$$P(C \mid X) = \frac{P(X \mid C)P(C)}{P(X)}$$

Prior

$P(C_1|x), P(C_2|x), \ldots, P(C_L|x)$

$P(C_1), P(C_2), \ldots, P(C_L)$

$$P(C_i \mid \mathbf{X}) = \frac{P(\mathbf{X} \mid C_i)P(C_i)}{P(\mathbf{X})}$$

Summary of Generative BC:

– Apply Bayes rule to get posterior probabilities

$$P(C = c_i \mid \mathbf{X} = \mathbf{x}) = \frac{P(\mathbf{X} = \mathbf{x} \mid C = c_i) P(C = c_i)}{P(\mathbf{X} = \mathbf{x})}$$
$$\propto P(\mathbf{X} = \mathbf{x} \mid C = c_i) P(C = c_i)$$
$$\text{for } i = 1, 2, \cdots, L$$

– Then apply the MAP rule

Adapt from Prof. Ke Chen NB slides

Summary of Generative BC:

– Apply Bayes rule to get posterior probabilities

$$\arg\max_{c_i} \{P(C = c_i \mid \mathbf{X} = \mathbf{x})\} = \frac{P(\mathbf{X} = \mathbf{x} \mid C = c_i)P(C = c_i)}{P(\mathbf{X} = \mathbf{x})}$$

$$\propto P(\mathbf{X} = \mathbf{x} \mid C = c_i)P(C = c_i)$$

$$\text{for } i = 1,2,\cdots,L$$

– Then apply the MAP rule

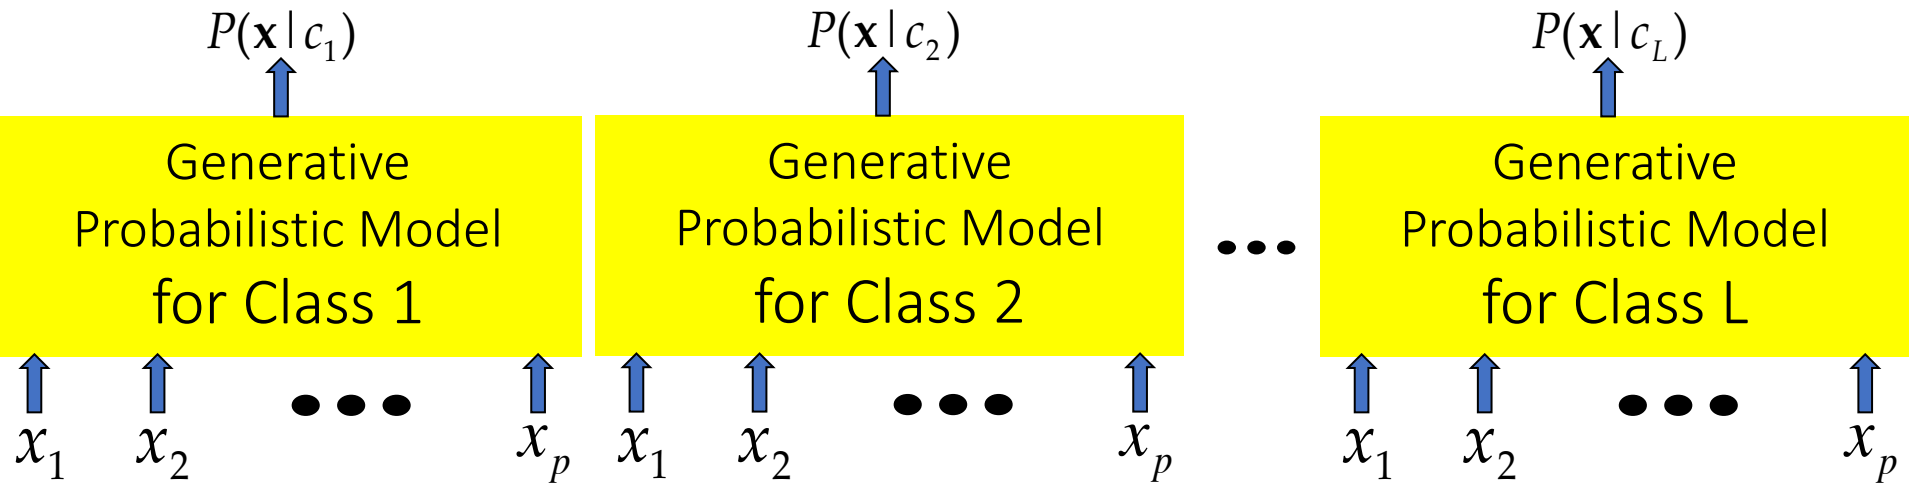
$\{ p(\vec{x} \mid c_i) \; p(c_i) \}$ $c_i \in \{c_1, c_2, \cdots, c_L\}$

Adapt from Prof. Ke Chen NB slides

Establishing a probabilistic model for classification through generative probabilistic models

[MAP rule]

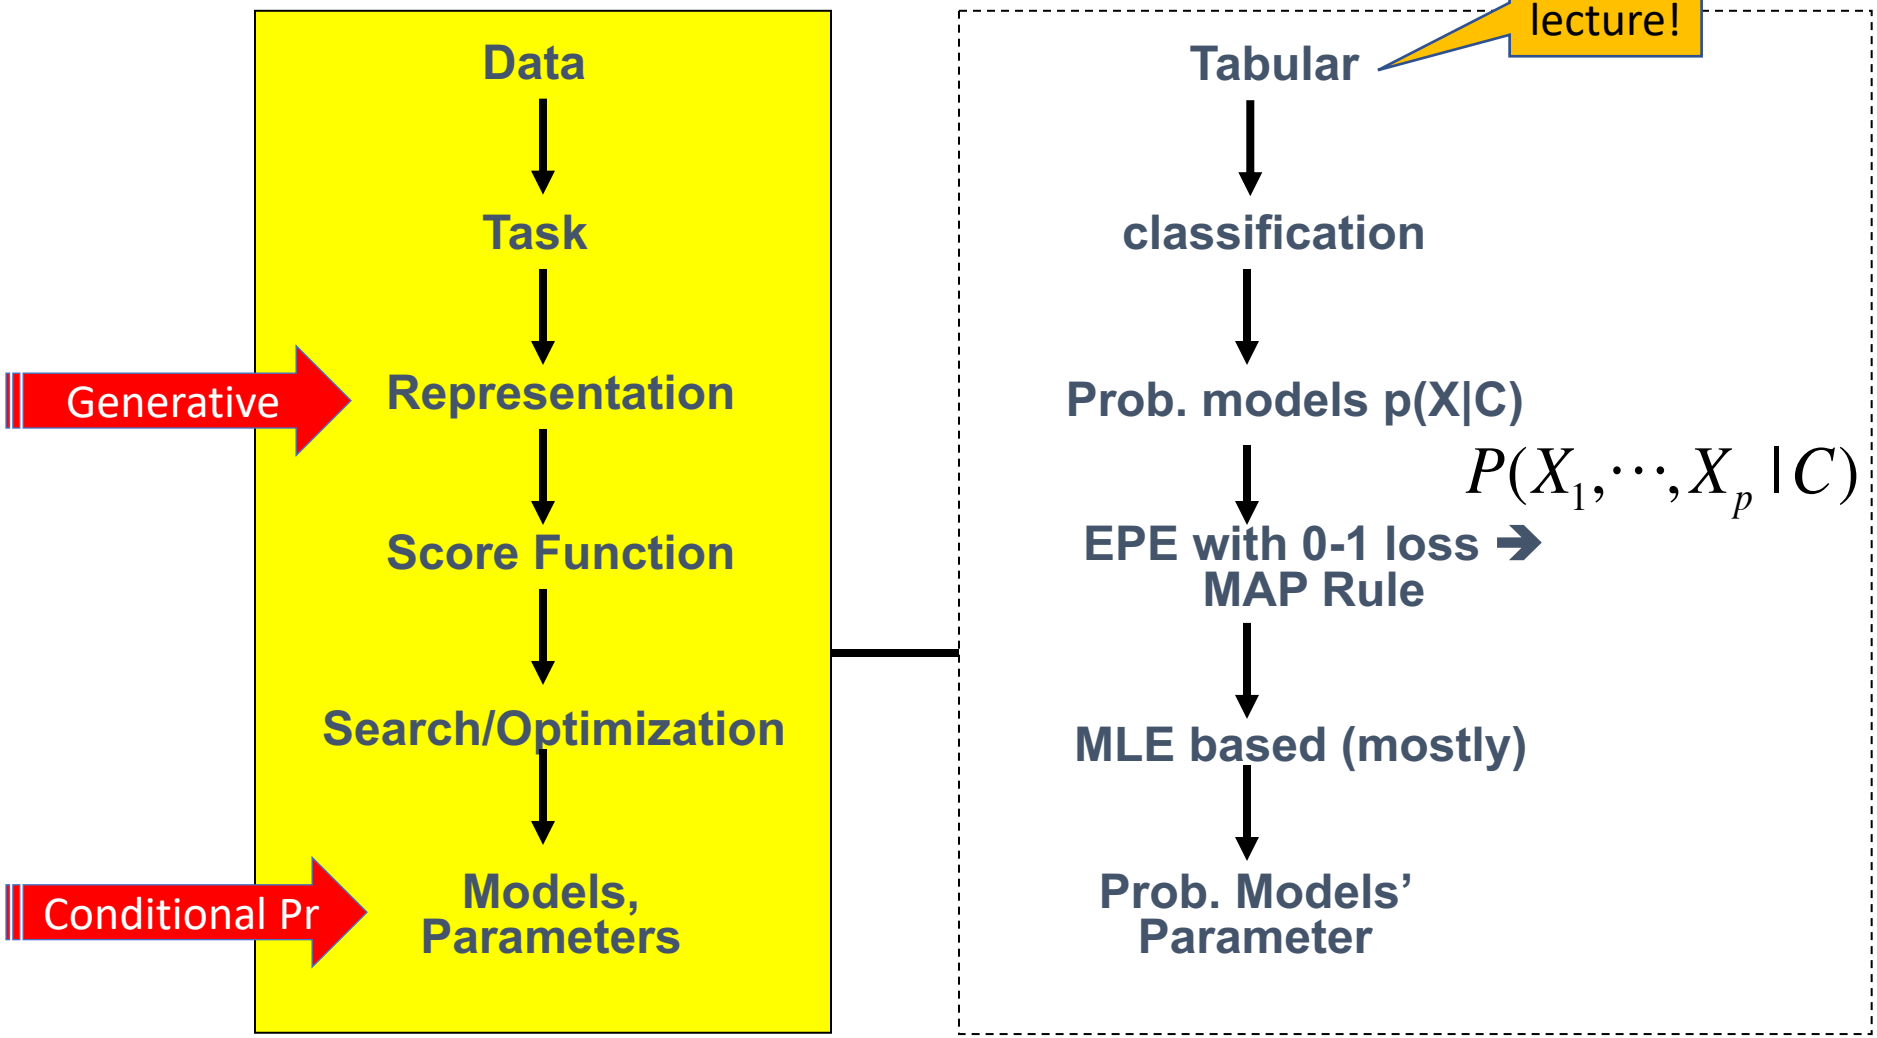
$$\underset{C_i}{\operatorname{argmax}} P(C_i \mid X) = \underset{C_i}{\operatorname{argmax}} P(X, C_i) = \underset{C_i}{\operatorname{argmax}} P(X \mid C_i) P(C_i)$$



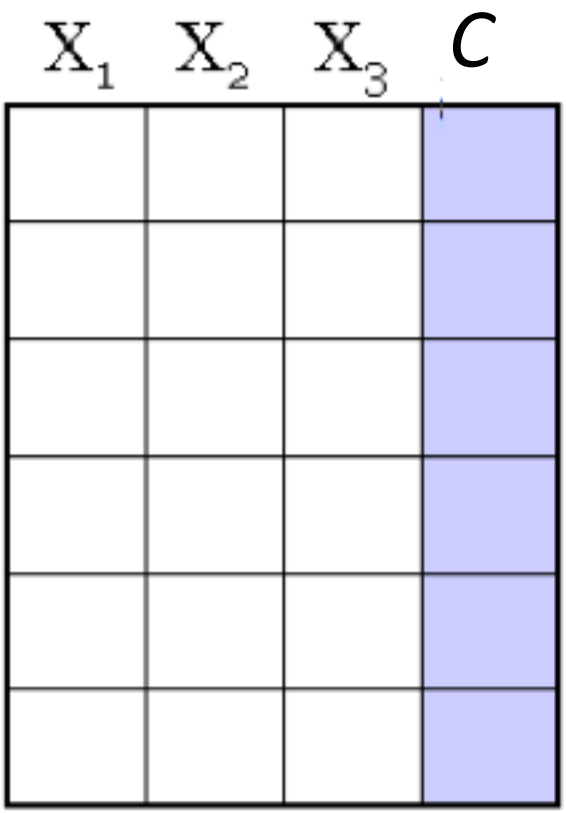
$$\mathbf{x} = (x_1, x_2, \cdots, x_p)$$

Adapt from Prof. Ke Chen NB slides

Generative Bayes Classifier



$$\underset{k}{\operatorname{argmax}}\, P(C\_k \mid X) = \underset{k}{\operatorname{argmax}}\, P(X,C) = \underset{k}{\operatorname{argmax}}\, P(X \mid C)P(C)$$



A Dataset for classification

$$f : X \longrightarrow C$$

Output as Discrete Class Label
$C_1, C_2, \ldots, C_L$

Discriminative

$$\arg\max_{c \in C} P(c / \mathbf{X}) \quad C = \{c_1, \cdots, c_L\}$$

Generative

$$\operatorname{argmax}_{c \in C} P(c \mid X) = \operatorname{argmax}_{c \in C} P(X, c) = \operatorname{argmax}_{c \in C} P(X \mid c) P(c)$$

this lecture!

An Example

- Example: Play Tennis

PlayTennis: training examples

Day	Outlook	Temperature	Humidity	Wind	PlayTennis
D1	Sunny	Hot	High	Weak	No
D2	Sunny	Hot	High	Strong	No
D3	Overcast	Hot	High	Weak	Yes
D4	Rain	Mild	High	Weak	Yes
D5	Rain	Cool	Normal	Weak	Yes
D6	Rain	Cool	Normal	Strong	No
D7	Overcast	Cool	Normal	Strong	Yes
D8	Sunny	Mild	High	Weak	No
D9	Sunny	Cool	Normal	Weak	Yes
D10	Rain	Mild	Normal	Weak	Yes
D11	Sunny	Mild	Normal	Strong	Yes
D12	Overcast	Mild	High	Strong	Yes
D13	Overcast	Hot	Normal	Weak	Yes
D14	Rain	Mild	High	Strong	No

X_1	X_2	X_3	C

X_1	X_2	X_3	X_4	C
S	H	H	W	C_1 = Yes
O	M	N	S	
R	C			C_2 = No

$3 \times 3 \times 2 \times 2 \times 2 \Rightarrow 72$ parameters

$\Rightarrow P(X_1\ X_2\ X_3\ X_4 \mid C),\ P(C)$ training

① $P(C=\text{Yes}) = \frac{N(\text{Yes})}{N(\text{train})} = \frac{9}{14}$

$P(C=\text{No}) = 1 - P(C=\text{Yes}) = \frac{5}{14}$

② $P(X_1=S, X_2=H, X_3=H, X_4=W \mid C=\text{No}) = \frac{N(SHHW \text{ in No})}{N(\text{No})} = \frac{1}{5}$

$P(X_1=S, X_2=H, X_3=H, X_4=W \mid C=\text{Yes}) = \frac{0}{9} = 0$

Learning Phase:

- Example: Play Tennis

PlayTennis: training examples

Day	Outlook	Temperature	Humidity	Wind	PlayTennis
D1	Sunny	Hot	High	Weak	No
D2	Sunny	Hot	High	Strong	No
D3	Overcast	Hot	High	Weak	Yes
D4	Rain	Mild	High	Weak	Yes
D5	Rain	Cool	Normal	Weak	Yes
D6	Rain	Cool	Normal	Strong	No
D7	Overcast	Cool	Normal	Strong	Yes
D8	Sunny	Mild	High	Weak	No
D9	Sunny	Cool	Normal	Weak	Yes
D10	Rain	Mild	Normal	Weak	Yes
D11	Sunny	Mild	Normal	Strong	Yes
D12	Overcast	Mild	High	Strong	Yes
D13	Overcast	Hot	Normal	Weak	Yes
D14	Rain	Mild	High	Strong	No

- Learning: maximum likelihood estimates
  - simply use the frequencies in the data

e.g. $P(\text{Overcast}, \text{hot}, \text{high}, \text{weak} \mid \text{Yes}) = \frac{1}{9}$

Directly estimate from data via counting

PlayTennis: training examples

Day	Outlook	Temperature	Humidity	Wind	PlayTennis
D1	Sunny	Hot	High	Weak	No
D2	Sunny	Hot	High	Strong	No
D3	Overcast	Hot	High	Weak	Yes
D4	Rain	Mild	High	Weak	Yes
D5	Rain	Cool	Normal	Weak	Yes
D6	Rain	Cool	Normal	Strong	No
D7	Overcast	Cool	Normal	Strong	Yes
D8	Sunny	Mild	High	Weak	No
D9	Sunny	Cool	Normal	Weak	Yes
D10	Rain	Mild	Normal	Weak	Yes
D11	Sunny	Mild	Normal	Strong	Yes
D12	Overcast	Mild	High	Strong	Yes
D13	Overcast	Hot	Normal	Weak	Yes
D14	Rain	Mild	High	Strong	No

e.g.

$P(\text{Overcast}, \text{hot}, \text{high}, \text{weak} \mid \text{No}) = \frac{0}{9}$

Check MLE Lecture for Why

$P(X_1, X_2, X_3, X_4 \mid Yes)$
$P(X_1, X_2, X_3, X_4 \mid No)$ → 36 x 2

PlayTennis: training examples

3*3*2*2 [conjunctions of attributes] * 2 [two classes]=72 parameters

Generative Bayes Classifier:

- Testing Phase
  - – Given an unknown instance $\mathbf{X}'_{ts} = (a'_1, \cdots, a'_p)$
  - – Look up tables to assign the label c* to X_{ts} if

Last Page: learned model

$$\hat{P}(a'_1, \cdots a'_p \mid c^*)\hat{P}(c^*) > \hat{P}(a'_1, \cdots a'_p \mid c)\hat{P}(c),$$

$$c \neq c^*, \; c = c_1, \cdots, c_L$$

  - – Given a new instance,

X'=(Outlook=Sunny, Temperature=Cool, Humidity=High, Wind=Strong)

$$\left\{ \begin{array}{l} P(x' \mid Yes)\, P(C=Yes) \\ P(x' \mid No)\, P(C=No) \end{array} \right\} \Rightarrow \underset{C}{\arg\max} \Rightarrow \text{predicted } C^*$$

$p(C=\text{Yes} \mid X_1, X_2, X_3, X_4)$

$p(C=\text{No} \mid X_1, X_2, X_3, X_4)$

→ $p(C=\text{Yes}) = 9/14$

$p(C=\text{No}) = 5/14$

→ $p(X_1, X_2, X_3, X_4 \mid C_i)$

$3 \times 3 \times 2 \times 2 \times 2 \Rightarrow 72$ parameters from train

→ $\underset{i=1,2}{\text{argmax}}\ p(\bar{X}_{ts} \mid C_i)\, p(C_i)$ Generative BC

Thank you

Today Recap: Generative Bayes Classifiers

- ✓ Bayes Classifier
  - Generative Bayes Classifier
- ✓ Naïve Bayes Classifier
- ✓ Gaussian Bayes Classifiers
  - Gaussian distribution
  - Naïve Gaussian BC
  - Not-naïve Gaussian BC ➔ LDA, QDA

Naïve Bayes Classifier

- Bayes classification

$$\underset{c_j \in C}{\operatorname{argmax}} P(x_1, x_2, \ldots, x_p \mid c_j) P(c_j)$$

$2 \times 2 \times \cdots \times 2 = 2^p \times L$

Difficulty: learning the joint probability

- Naïve Bayes classification
  - Assumption that all input attributes are conditionally independent!

(when given C_i)

Naïve Bayes Classifier

- Bayes classification

$$\underset{c_j \in C}{\operatorname{argmax}} P(x_1, x_2, \ldots, x_p \mid c_j) P(c_j)$$

$= P(x_1 \mid c_j)\, P(x_2 \mid c_j) \cdots P(x_p \mid c_j)$

Difficulty: learning the joint probability

- Naïve Bayes classification
  - Assumption that all input attributes are conditionally independent!

given C variable

Naïve Bayes Classifier

- Naïve Bayes classification
  - Assumption that all input attributes are conditionally independent!

[assumption]

$$P(X_1, X_2, \cdots, X_p|C) = P(X_1|C)P(X_2|C) \cdots P(X_p|C)$$

$$P(C_j|X_1, \cdots X_p) \propto P(X_1, X_2, \cdots X_p|C_j)P(C_j)$$

$$= P(X_1|C_j)P(X_2|C_j) \cdots P(X_p|C_j)P(C_j)$$

$3 \times L$		$P(X_1 \mid C)$
X_1 = Sunn	C = Yes	$\frac{N(S, Yes)}{N(Yes)} = \frac{2}{9}$
$X_1 = O$	C = Yes	
$X_1 = R$	C = Yes	
$X_1 = S$	C = No	$\frac{N(S, N)}{N(No)} = \frac{3}{5}$
O	C = No	
R	C = No	

$X_1 : 3 \times L$

$X_2 : 3 \times L$

$X_3 : 2 \times L$

$X_4 : 2 \times L$

$L=2$	$P(C=Ye)$	$P(C=N)$
	$9/14$	$5/14$

No Naive

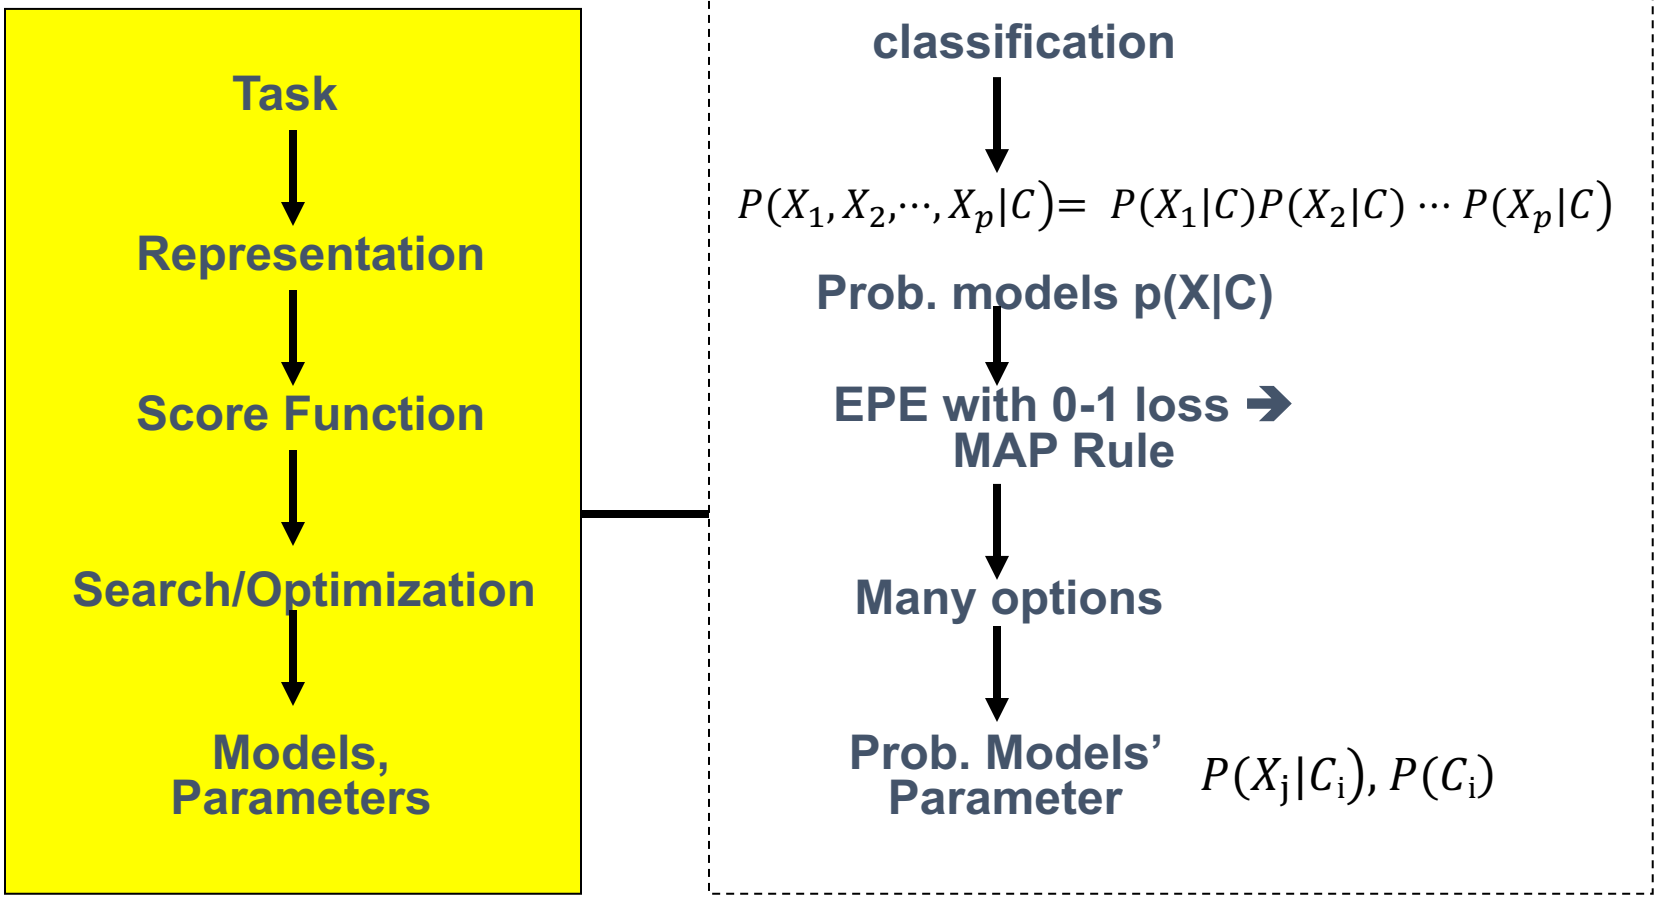
$72 + 2 = 74$ para

$2^P \cdot L$

$(3+3+2+2) \times \underbrace{L}_{=2} = 20 \; \underbrace{+2}$

$\Rightarrow X_1 + X_2 + \ldots + X_P \Rightarrow \underbrace{2PL}$ $P \sim 30k$

Naive Bayes Classifier



Estimate $P(X_j = x_{jk} | C = c_i)$ with examples in training;

look up

$$[\hat{P}(a'_1|c^*)\cdots\hat{P}(a'_p|c^*)]\hat{P}(c^*) > [\hat{P}(a'_1|c)\cdots\hat{P}(a'_p|c)]\hat{P}(c)$$

- Test Phase
  - Given a new instance,

    x'=(Outlook=Sunny, Temperature=Cool, Humidity=High, Wind=Strong)

Using the NBC Model

$$[\hat{P}(a'_1|c^*)\cdots\hat{P}(a'_p|c^*)]\hat{P}(c^*) > [\hat{P}(a'_1|c)\cdots\hat{P}(a'_p|c)]\hat{P}(c)$$

- Test Phase
  - Given a new instance,

    x'=(Outlook=Sunny, Temperature=Cool, Humidity=High, Wind=Strong)

$\rightarrow P(C_1)P(\text{Sunny}|C_1)P(\text{Cool}|C_1)P(\text{High}|C_1)P(\text{Strong}|C_1)$

$= \frac{9}{14} \times \frac{2}{9} \cdots =$

$\rightarrow P(C_2)P(\text{Su}|C_2)P(\text{Co}|C_2)P(\text{hi}|C_2)P(\text{St}|C_2)$

$= \frac{5}{14} \times \frac{3}{5} \times \cdots =$

Testing the NBC Model

$$[\hat{P}(a_1'|c^*)\cdots\hat{P}(a_p'|c^*)]\hat{P}(c^*) > [\hat{P}(a_1'|c)\cdots\hat{P}(a_p'|c)]\hat{P}(c)$$

- Test Phase
  - Given a new instance,

    x'=(Outlook=Sunny, Temperature=Cool, Humidity=High, Wind=Strong)
  - Look up in conditional-prob tables

P(Outlook=Sunny|Play=Yes) = 2/9	P(Outlook=Sunny|Play=No) = 3/5
P(Temperature=Cool|Play=Yes) = 3/9	P(Temperature=Cool|Play==No) = 1/5
P(Huminity=High|Play=Yes) = 3/9	P(Huminity=High|Play=No) = 4/5
P(Wind=Strong|Play=Yes) = 3/9	P(Wind=Strong|Play=No) = 3/5
P(Play=Yes) = 9/14	P(Play=No) = 5/14

$$[\hat{P}(a_1'|c^*)\cdots\hat{P}(a_p'|c^*)]\hat{P}(c^*) > [\hat{P}(a_1'|c)\cdots\hat{P}(a_p'|c)]\hat{P}(c)$$

- Test Phase
  - Given a new instance,

    X'=(Outlook=Sunny, Temperature=Cool, Humidity=High, Wind=Strong)
  - Look up in conditional-prob tables

P(Outlook=Sunny|Play=Yes) = 2/9	P(Outlook=Sunny|Play=No) = 3/5
P(Temperature=Cool|Play=Yes) = 3/9	P(Temperature=Cool|Play==No) = 1/5
P(Huminity=High|Play=Yes) = 3/9	P(Huminity=High|Play=No) = 4/5
P(Wind=Strong|Play=Yes) = 3/9	P(Wind=Strong|Play=No) = 3/5
P(Play=Yes) = 9/14	P(Play=No) = 5/14

  - MAP rule

    P(Yes|X'): [P(Sunny|Yes)P(Cool|Yes)P(High|Yes)P(Strong|Yes)]P(Play=Yes) = 0.0053

    P(No|X'): [P(Sunny|No) P(Cool|No)P(High|No)P(Strong|No)]P(Play=No) = 0.0206

    Given the fact P(Yes|X') < P(No|X'), we label X' to be "No".

WHY ? Naïve Bayes Assumption

- $P(c_j)$
  - Can be estimated from the frequency of classes in the training examples.
- $P(x_1,x_2,\ldots,x_p|c_j)$
  - $O(|X_1|.|X_2|.|X_3|\ldots.|X_p|.|C|)$ parameters
  - Could only be estimated if a very, very large number of training examples was available.

Not Naïve

- $P(x_k|c_j)$
  - $O([|X_1|+|X_2|+|X_3|\ldots.+|X_p|].|C|)$ parameters
  - Assume that the probability of observing the conjunction of attributes is equal to the product of the individual probabilities $P(x_i|c_j)$.

Naïve

WHY ? Naïve Bayes Assumption

Assuming $|C| = L$ (num of unique values)

- $P(c_j)$
  - Can be estimated from the frequency of classes in the training examples.

Not Naïve

- $P(x_1, x_2, \ldots, x_p | c_j)$
  - $O(|X_1| \cdot |X_2| \cdot |X_3| \ldots |X_p| \cdot |C|)$ parameters
  - Could only be estimated if a very, very large number of training examples was available.

Assuming $|X_i| = 2$, $i = 1, 2, \cdots, p$

$\Rightarrow 2^p \times L$ (Exp)

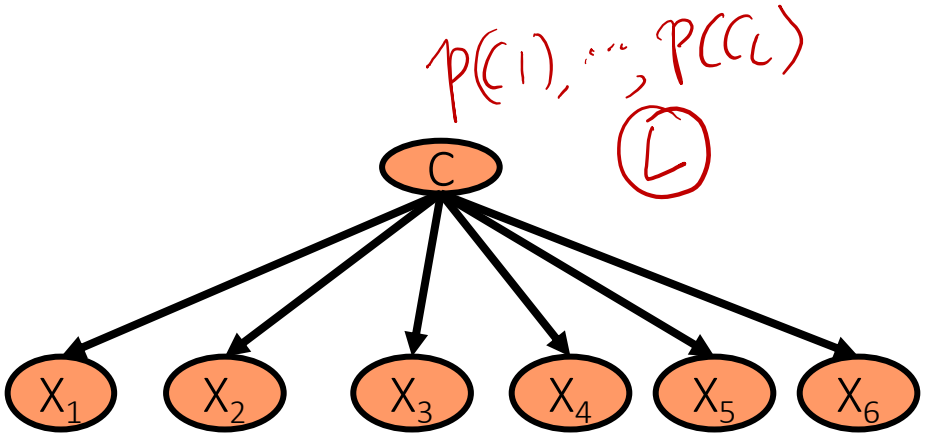
Naïve

- $P(x_k | c_j)$
  - $O([|X_1| + |X_2| + |X_3| \ldots + |X_p|] \cdot |C|)$ parameters
  - Assume that the probability of observing the conjunction of attributes is equal to the product of the individual probabilities $P(x_i | c_j)$.

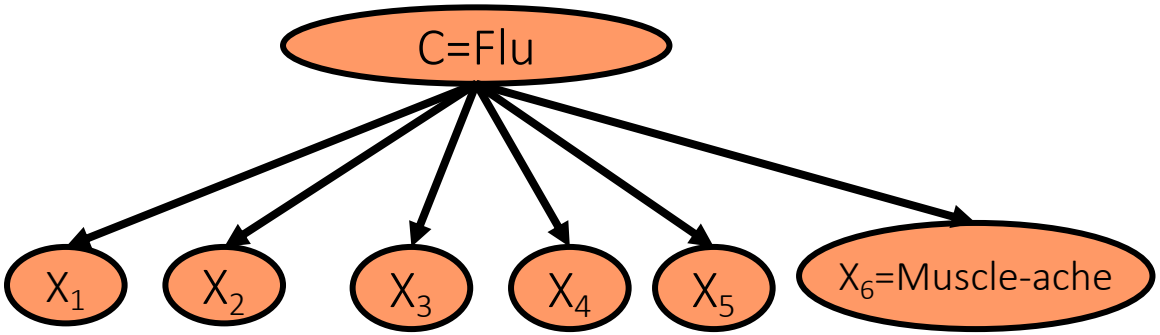
$(2+2+2+\cdots 2) \times L$

$= 2 * p * L$ (Linear)

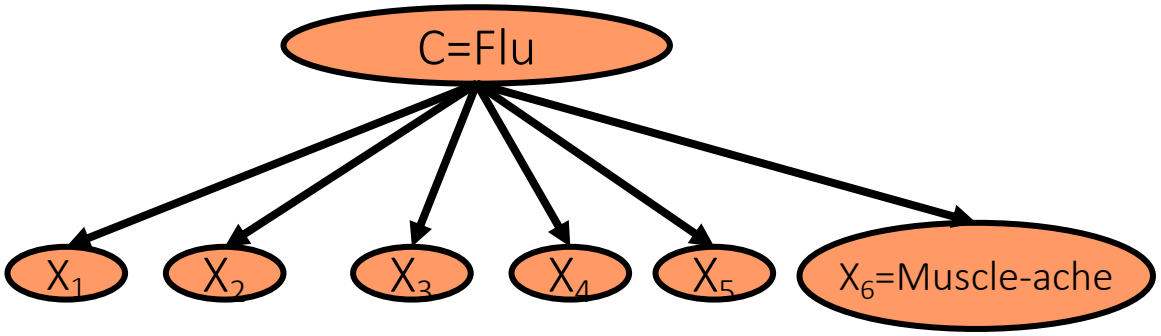
Challenges during Learning (training) the NBC Model



For instance:



For instance:



- What if we have seen no training cases where patient had no flu and muscle aches?

$$\hat{P}(X_6 = T | C = not\_flu) = \frac{N(X_6 = T, C = nf)}{N(C = nf)} = 0$$

muscle-ache Yes/no flu/nf

- Zero probabilities cannot be conditioned away, no matter the other evidence!

$$?? = \arg\max_c \hat{P}(c) \prod_i \hat{P}(x_i | c)$$

$$\delta_f = p(c=f|u)\, p(x_1|f)\, p(x_2|f)\, p(x_3|f)\, p(x_4|f)\, p(x_5|f)\, p(x_6|f)$$

$$\delta_{nf} = p(c=nf)\, p(x_1|nf)\, p(x_2|nf)\, p(x_3|nf)\, p(x_4|nf)\, p(x_5|nf)\, p(x_6|nf)$$

if any term gives 0,

$\Rightarrow \delta_{nf} = 0$

no matter other terms' value

Smoothing to Avoid Overfitting

Why necessary ??

$$\hat{P}(x_i \mid c_j) = \frac{N(X_i = x_i, C = c_j) + 1}{N(C = c_j) + k_i}$$

# of values of feature X_i

To make sum_i (P(xi|Cj)=1

$|X_i| = k_i$

Smoothing to Avoid Overfitting

$$\hat{P}(x_i \mid c_j) = \frac{N(X_i = x_i, C = c_j) + 1}{N(C = c_j) + k_i}$$

# of values of X_i

- Somewhat more subtle version

overall fraction in data where $X_i = x_{i,k}$

$$\hat{P}(x_{i,k} \mid c_j) = \frac{N(X_i = x_{i,k}, C = c_j) + mp_{i,k}}{N(C = c_j) + m}$$

$k \in \{1, 2, \ldots, k_i\}$

extent of "smoothing"

Summary:

Generative Bayes Classifier

Task: Classify a new instance X based on a tuple of attribute values $X = \langle X_1, X_2, \ldots, X_p \rangle$ into one of the classes

$$c_{MAP} = \underset{c_j \in C}{\operatorname{argmax}} P(c_j \mid x_1, x_2, \ldots, x_p)$$

$$= \underset{c_j \in C}{\operatorname{argmax}} \frac{P(x_1, x_2, \ldots, x_p \mid c_j) P(c_j)}{P(x_1, x_2, \ldots, x_p)}$$

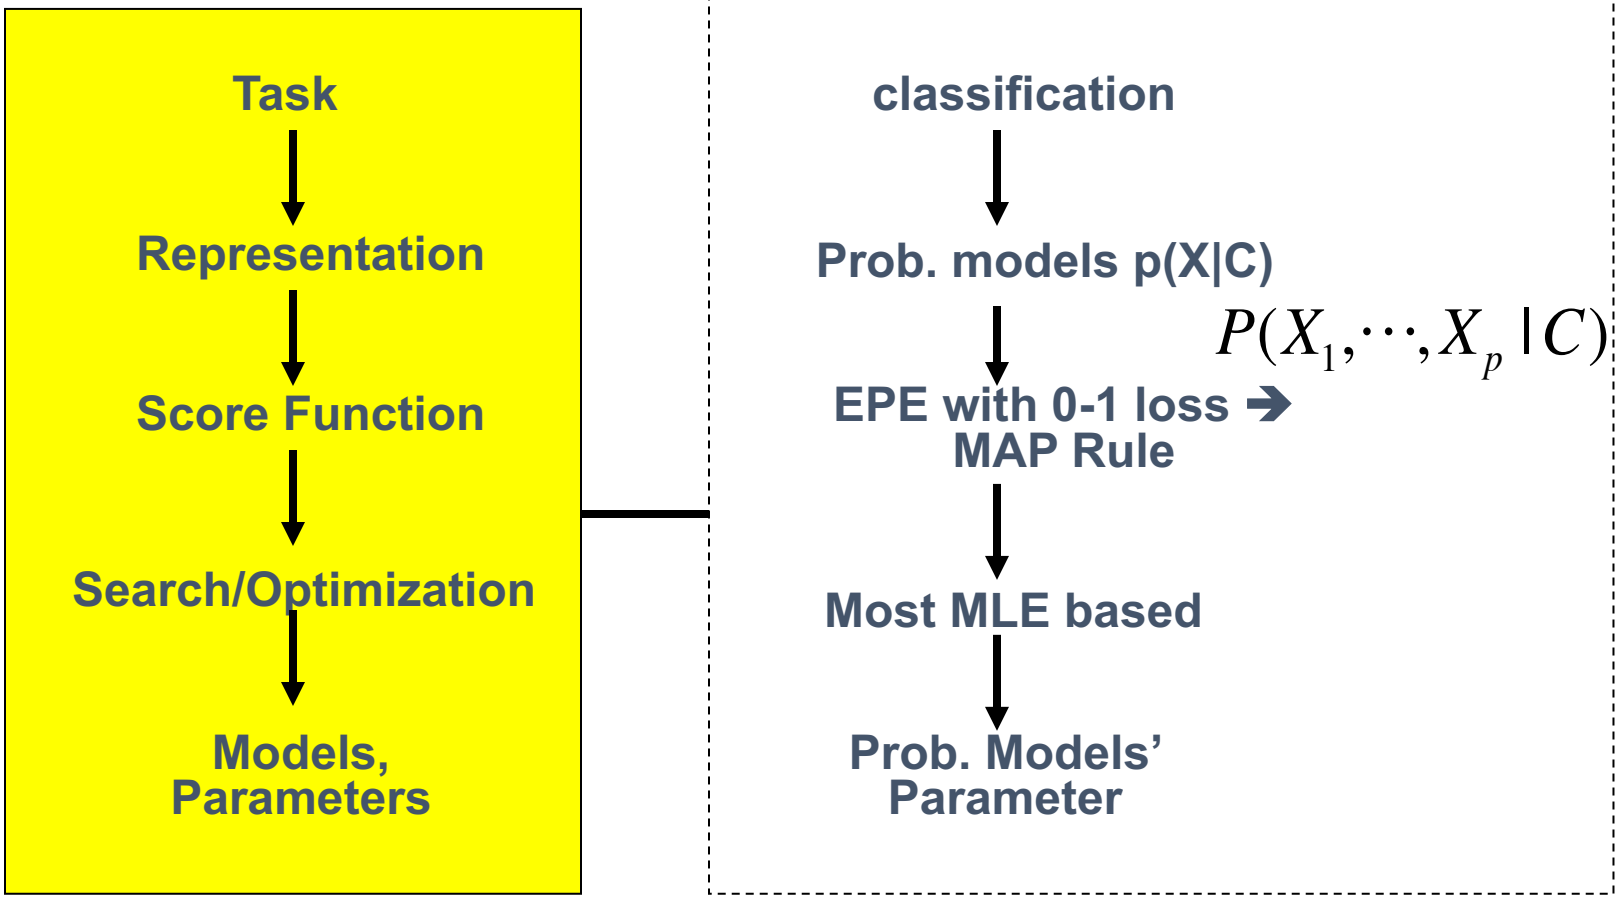
$$= \underset{c_j \in C}{\operatorname{argmax}} P(x_1, x_2, \ldots, x_p \mid c_j) P(c_j)$$

$j = 1, 2, \ldots, L$

MAP = Maximum A Posteriori

Adapt From Carols' prob tutorial

Today Recap: Generative Bayes Classifier and Naïve BC



$$\underset{k}{\operatorname{argmax}}\, P(C\_k \mid X) = \underset{k}{\operatorname{argmax}}\, P(X,C) = \underset{k}{\operatorname{argmax}}\, P(X \mid C)P(C)$$

Bernoulli Naïve

$$p(W_i = true \mid c_k) = p_{i,k}$$

Thank you
